Week 4A: QOD7 Polymorphism

Add WeChat powcoder

Giulia Alberini, Fall 2020

WHAT ARE WE GOING TO DO IN THIS VIDEO?

OOD7

Assignment Project Exam Help

- instanceof

<https://powcoder.com>

- Intro to Polymorphism

Add WeChat powcoder

- Abstract Classes and Methods

A LITTLE ABOUT instanceof

- The instanceof operator is used to test whether an object is an instance of the specified type.

Assignment Project Exam Help

- It returns either true or false. If we apply the instanceof operator with any variable that has null value, it returns false.

<https://powcoder.com>

Add WeChat powcoder

```
Dog myDog = new Dog();  
Beagle snoopy = new Beagle();  
Dog aDog = null;  
System.out.println(myDog instanceof Dog); // true  
System.out.println(snoopy instanceof Dog); // true  
System.out.println(aDog instanceof Dog); // false
```

instanceof AND DOWNCASTING

- When can use instanceof to make sure that downcasting to a subclass will not cause a run time error.

<https://powcoder.com>

Add WeChat powcoder

```
public static void myMethod(Dog myDog) {  
    if(myDog instanceof Beagle) {  
        Beagle b = (Beagle) myDog; // downcasting  
        b.hunt();  
    }  
}
```

instanceof AND equals ()

- Note that in general we want to use `instanceof` as a last resort. We'll see why shortly.
- That said, we have to use `instanceof` when overriding `equals ()`

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

```
public class Dog {  
    Person owner;  
    :  
    public boolean equals(Object obj) {  
        if(obj instanceof Dog) {  
            ...  
        }  
    }  
}
```

WHERE WE LEFT OFF

class Dog

Person owner

```
public void bark() {  
    print("woof!");  
}
```

:

↑ extends

class Beagle

void hunt ()

```
public void bark() {  
    print("aowwwuuu");  
}
```

:

```
public class Test {  
    public static void main(String[] args) {  
        Dog snoopy = new Beagle();  
        snoopy.bark();  
    }  
}
```

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

Is this
allowed??

If so, which
bark() will
execute???

Yes, it's an
example of
upcasting!

Assignment Project Exam Help

POLYMORPHISM

<https://powcoder.com>

Add WeChat powcoder

POLYMORPHISM

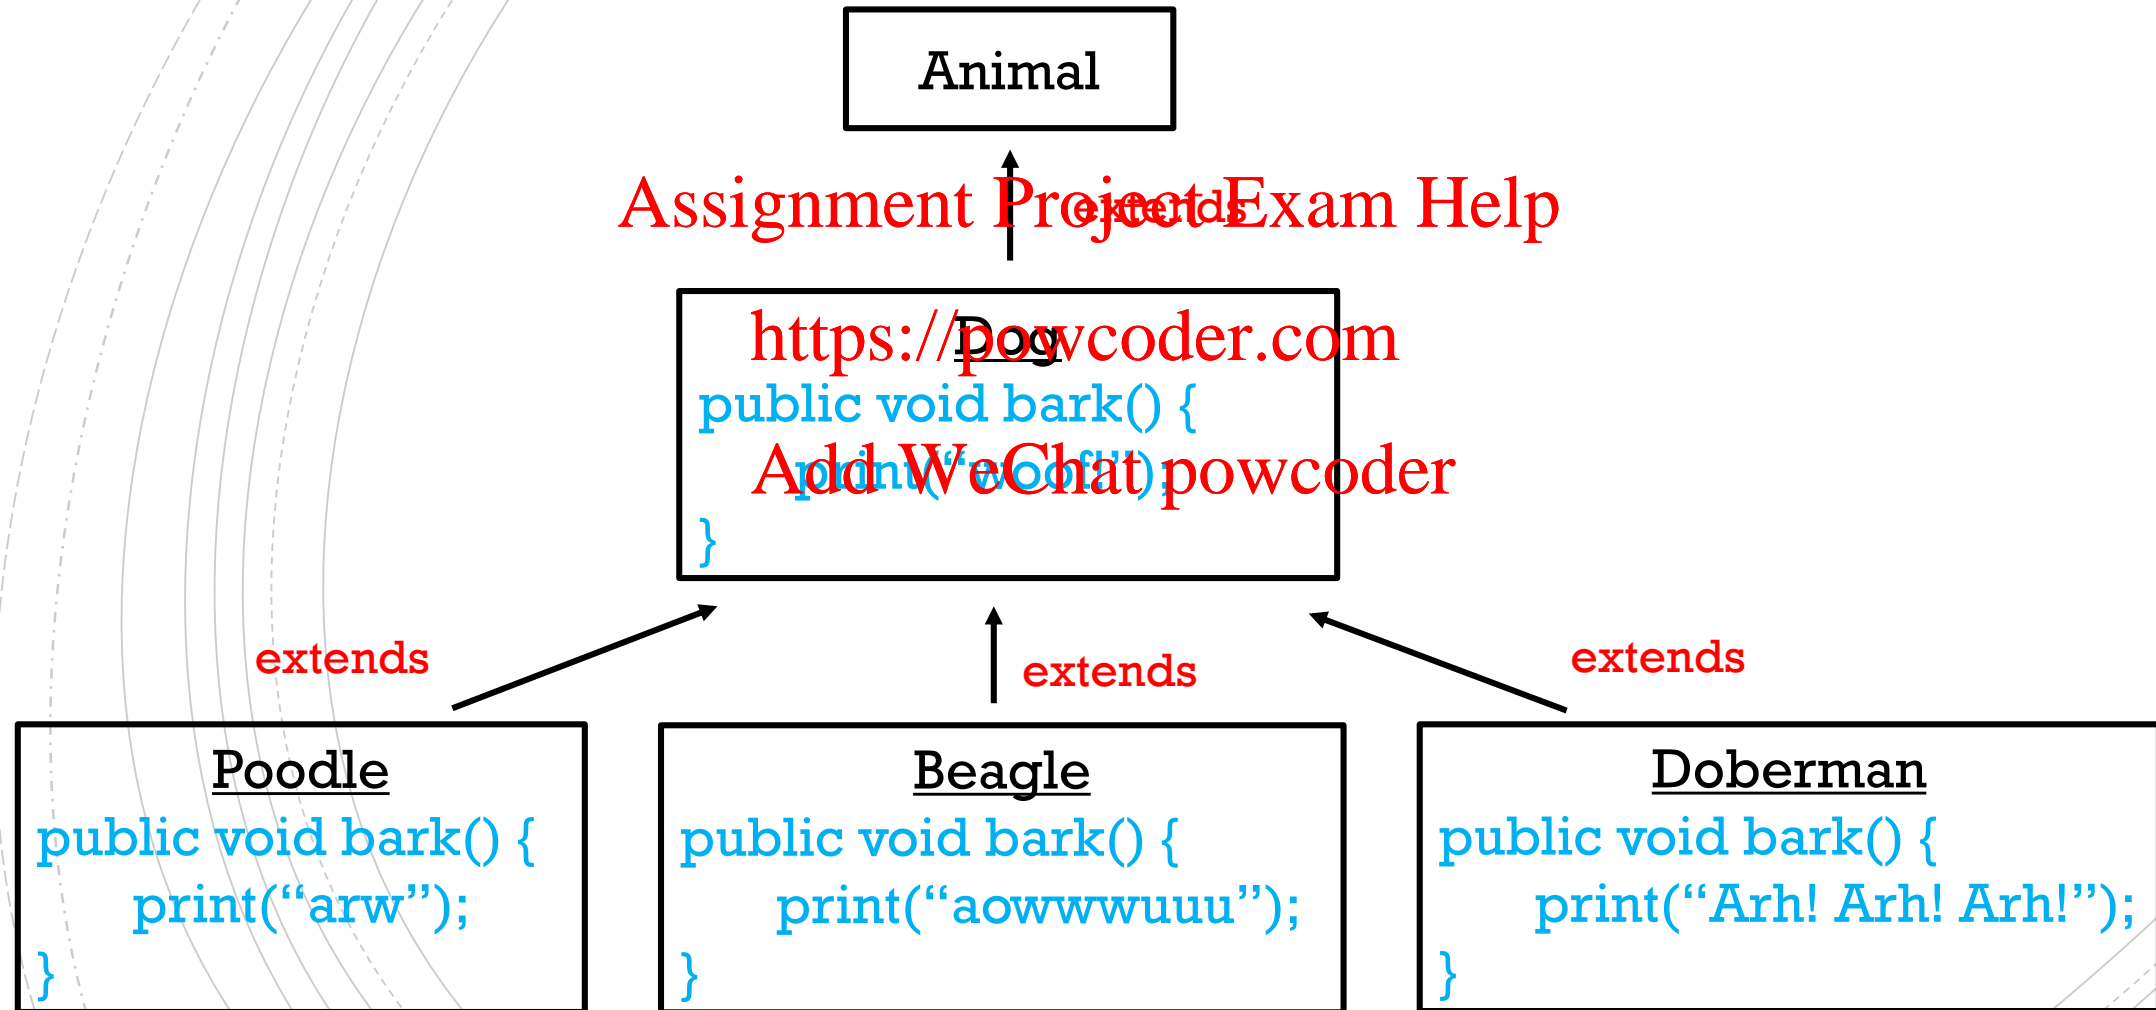

- Each object can have different “forms”.

Assignment Project Exam Help

- One important aspect of polymorphism in Java: “the Java virtual machine (JVM) calls the appropriate method for the object that is referred to in each variable. It does not call the method that is defined by the variable's type”.

- More general discussion about polymorphism in higher level courses.
(e.g. COMP 302)

RECALL HIERARCHY FROM OUR EXAMPLES

EXAMPLE

```
Dog myDog = new Dog();  
myDog.bark();  
  
Dog snoopy = new Beagle();  
snoopy.bark();
```

OUTPUT

```
woof!  
  
aowwwuuu
```

The compiler sees `bark()` in the `Dog` class (myDog is of type `Dog`) at compile time, the JVM invokes `bark()` from the `Dog` class at run time (myDog points to an object of type `Dog`).

At compile time, the compiler uses `bark()` in the `Dog` class to validate the statement. At run time, however, the JVM invokes `bark()` from the `Beagle` class. (snoopy is actually referring to a `Beagle` object)

Add WeChat powcoder

THE "OO WAY"

- Favor polymorphism and dynamic binding to downcasting and `instanceOf`. **Assignment Project Exam Help**

<https://powcoder.com>

- From *Effective C++*, by Scott Meyers:
Add WeChat powcoder

"Anytime you find yourself writing code of the form 'if the object is of type T1, then do something, but if it's of type T2, then do something else', slap yourself".

TRY IT!

- Let's go back to our Shape classes. On the first video I suggested you to write a method `displayInfo()` in the Shape class and override it in Circle and Triangle. Let's then create an array of Shapes and see how we can exploit polymorphism when displaying the info of the elements in the array.

Assignment Project Exam Help

abstract

<https://powcoder.com>

Add WeChat powcoder

LET'S LOOK AT AN EXAMPLE

- Suppose we created the following two classes to work with Circles and Triangles.

Assignment Project Exam Help

Circle

- color: String
- radius: double
- + getColor(): String
- + setColor(c:String)
- + getRadius():double
- + getArea(): double

Triangle

- color: String
- base: double
- height: double
- + getColor(): String
- + setColor(c:String)
- +getArea(): double

<https://powcoder.com>

Add WeChat powcoder

LET'S LOOK AT AN EXAMPLE

- Suppose we created the following two classes to work with Circles and Triangles.

Assignment Project Exam Help

Circle

```
- color: String
- radius: double
+ getColor(): String
+ setColor(c:String)
+ getRadius():double
+ getArea(): double
```

Triangle

```
- color: String
- base: double
- height: double
+ getColor(): String
+ setColor(c:String)
+getArea(): double
```

Observations:

- The two classes are closely related. They are both used to represent geometrical shapes.

LET'S LOOK AT AN EXAMPLE

- Suppose we created the following two classes to work with Circles and Triangles.

Assignment Project Exam Help

Circle

```
- color: String
- radius: double
+ getColor(): String
+ setColor(c:String)
+ getRadius():double
+ getArea(): double
```

Triangle

```
https://powcoder.com
- color: String
- base: double
- height: double
+ getColor(): String
+ setColor(c:String)
+ getArea(): double
```

Observations:

- There's code that is repeated: the two classes share fields and methods that are implemented in the same way.

LET'S LOOK AT AN EXAMPLE

- Suppose we created the following two classes to work with Circles and Triangles.

Assignment Project Exam Help

Circle

```
- color: String
- radius: double
+ getColor(): String
+ setColor(c:String)
+ getRadius():double
+ getArea(): double
```

Triangle

```
- color: String
- base: double
- height: double
+ getColor(): String
+ setColor(c:String)
+ getArea(): double
```

Observations:

<https://powcoder.com>

Add WeChat powcoder.

- There's a method that serves the same purpose in both classes, but it's implemented differently depending on the class.

LET'S LOOK AT AN EXAMPLE

- Suppose we created the following two classes to work with Circles and Triangles.

Assignment Project Exam Help

Circle

```
- color: String
- radius: double
+ getColor(): String
+ setColor(c:String)
+ getRadius():double
+ getArea(): double
```

Triangle

```
- color: String
- base: double
- height: double
+ getColor(): String
+ setColor(c:String)
+ getArea(): double
```

Observations:

- There are fields and methods that are specific to each class.

LET'S LOOK AT AN EXAMPLE

- Suppose we created the following two classes to work with Circles and Triangles.

Assignment Project Exam Help

Circle

```
- color: String
- radius: double
+ getColor(): String
+ setColor(c:String)
+ getRadius():double
+ getArea(): double
```

Triangle

```
- color: String
- base: double
- height: double
+ getColor(): String
+ setColor(c:String)
+getArea(): double
```

Observations:

- It is the perfect situation to create an abstract superclass!

abstract METHODS

- If you want a class to contain a particular method, but you would like the implementation of this method to be specified by the subclasses, then you can declare the method to be `abstract`.

Assignment Project Exam Help

<https://powcoder.com>

- An abstract method is a method that is declared without implementation:

Add WeChat powcoder

```
public abstract double getArea();
```

The method has no body! Instead of the curly braces, we use the semicolon at the end of the header.

abstract METHODS

Declaring a method as abstract has 2 consequences:

Assignment Project Exam Help

- The class containing it must be also declared abstract.

Add WeChat powcoder

- Every subclass of the current class MUST either override the abstract method or declare it itself as abstract.

abstract CLASSES

- An abstract class must be declared using the `abstract` keyword.

- It can have `abstract` and `non-abstract` methods.

<https://powcoder.com>

- It cannot be instantiated.

Add WeChat powcoder

- It can have constructors and static methods.
- It can have `final` methods which will force the subclass not to change the body of the method

abstract CLASSES – OBSERVATIONS

- We can have abstract classes with no abstract methods. This allow us to create classes that cannot be instantiated, but can only be inherited.

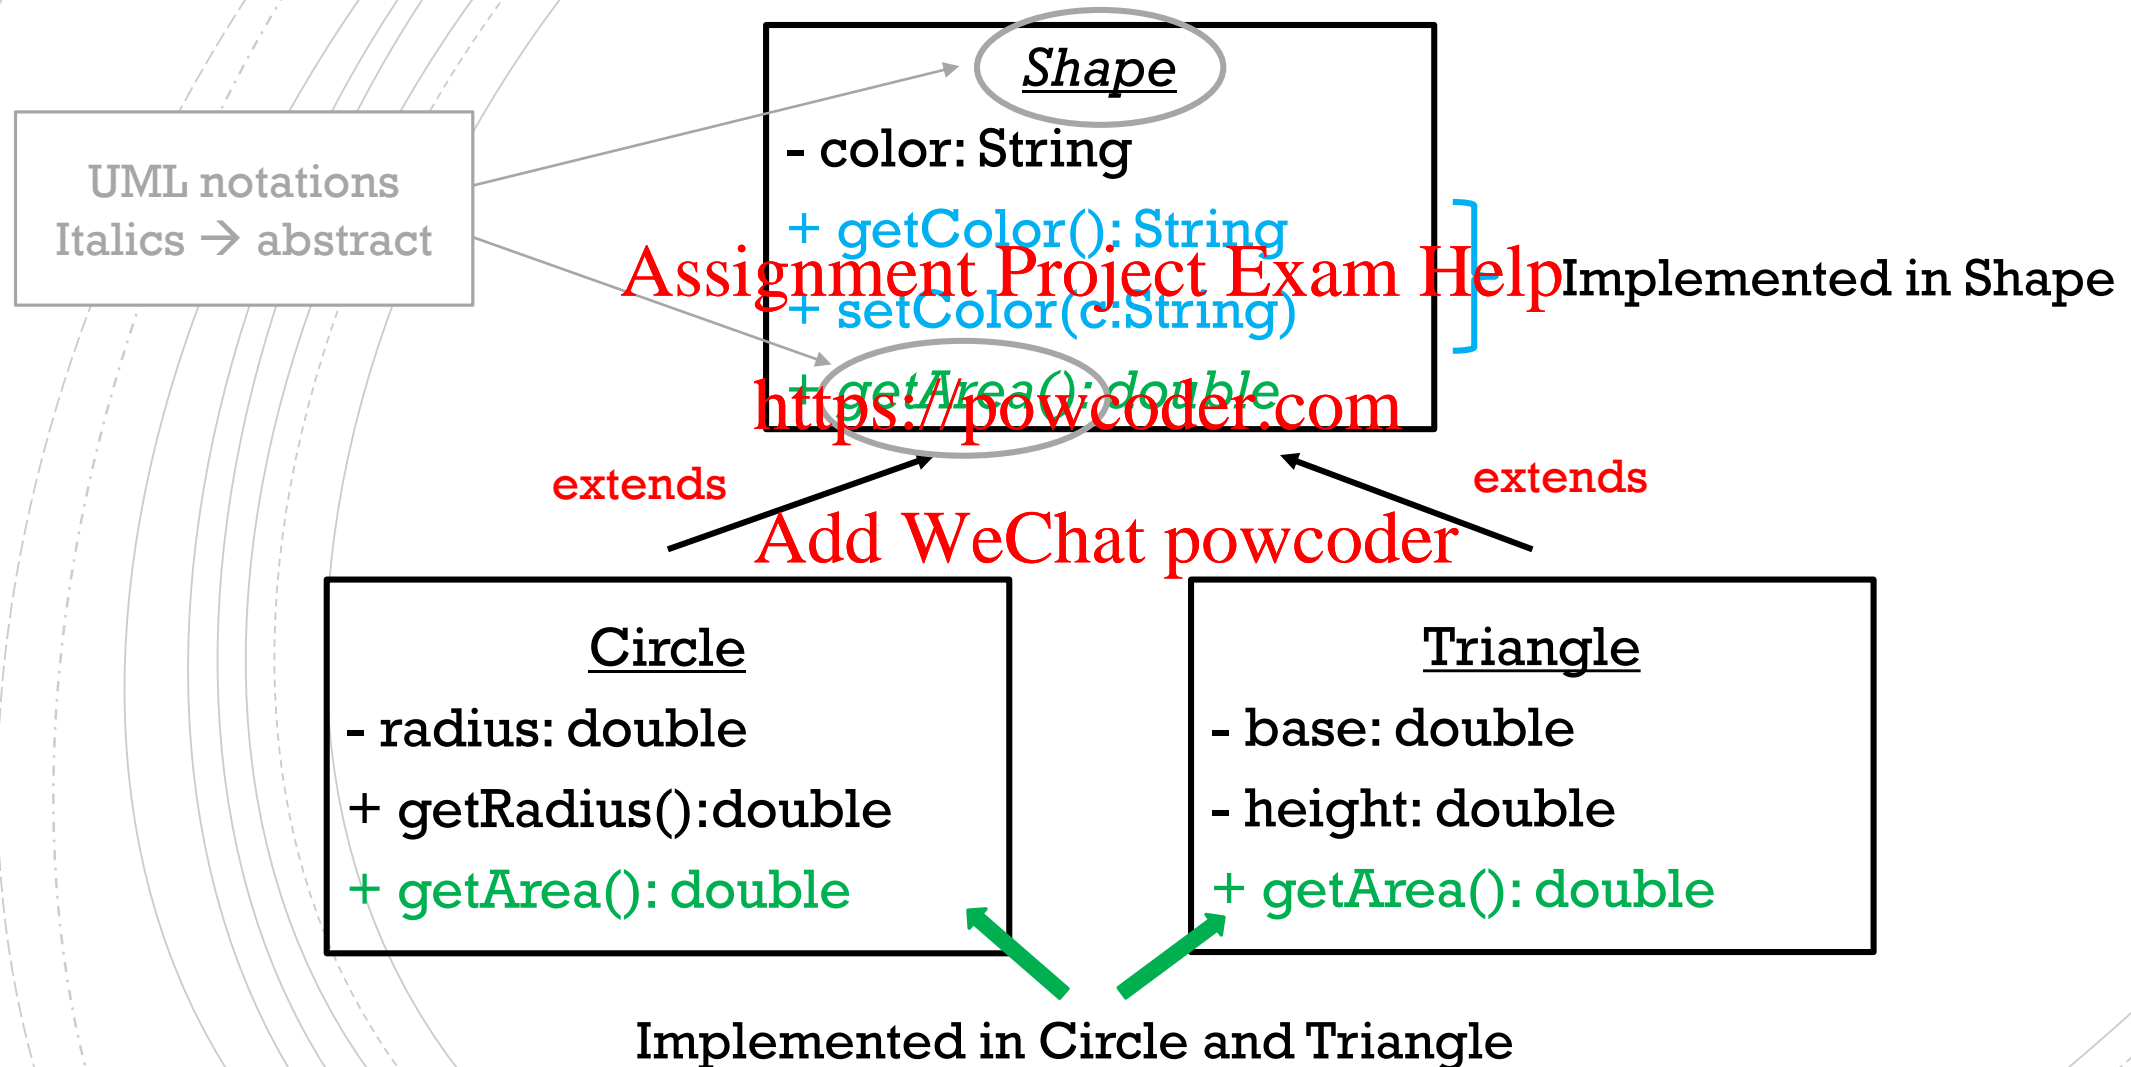

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

- We cannot instantiate an abstract class, but we can define constructors. These constructors are called when an instance of a subclass is created.

BACK TO OUR EXAMPLE

TRY IT!

- Go back to the Shape class and modified it by adding an abstract `getArea()` method

Assignment Project Exam Help

<https://powcoder.com>

- Add constructors to the three classes.

Add WeChat powcoder

- Play around with the classes!
